

Scholi — Deploy to Render (Professional)

Follow these steps to deploy Scholi on Render (professional guide):

- 1) Create a Render account at <https://render.com> and connect your GitHub account.
- 2) Ensure your repository is at: <https://github.com/mejakivos/scholi-demo> (main branch).
- 3) In Render dashboard, click 'New' → 'Import from GitHub' → select repo 'mejakivos/scholi-demo'.
- 4) Render will detect services from `render.yaml`. Confirm and create services: `scholi-db`, `scholi-backend`, `scholi-frontend`.
- 5) Set environment variables: `JWT_SECRET` (secure random), verify `DATABASE_URL` is sourced from `scholi-db`.
- 6) Start the deploy and watch logs. Backend on port 4000, frontend will be a static site URL.
- 7) Verify by visiting the frontend URL and check backend health endpoint `/api/seed` or `/health`.
